Subject: TES QUESTIONNAIRE

Roger,

Per your request, attached is a stand-alone version of the questionnaire without the name of the CRO.

TES PILOT QX.doc

With best regards,

Bettie

Subject: RE: New publication on ETS exposure and adult onset of asthma

Roger,

Providing information in an e-mail format is an effective way to keep everyone up to date on issues that impact the research that we are doing.

Bettie

Correction (too bad that this happens with the 1st communication).

Instead of the 2001 IOM Report 'Clearing the smoke' our scientific consensus opinion refers to the 2000 IOM Report 'Clearing the Air. Asthma and Indoor Air Exposure'. My apologies.

Subject: New publication on ETS exposure and adult onset of asthma

Dear All,

Here is a short review of a recently published S&H-related poster abstract. Ted Sanders has put the reported results of the abstract into the context of our consensus on asthma in ETS exposed adults. Sharing this review with you could help to better know our scientific consensus and to better understand the significance of the new publication.

Review:

Our recently agreed upon PM scientific consensus on adult health effects and ETS exposure takes the position that there was no evidence for an association of adult onset of asthma with ETS exposure. This opinion rests primarily on the recently (2001) published report prepared by the Institute of Medicine entitled, "Clearing the Smoke. Assessing the Science Base for Tobacco Harm Reduction."

On September 25, 2001, Jaakkola, et al., presented a poster at the 11th European Respiratory Society Annual Meeting in Berlin wherein an association of ETS exposure and adult onset of asthma was found both with respect to workplace exposure (OR = 2.43) and with spousal exposure (OR = 1.63).

For two reasons this publication does not suggest that our consensus position be changed at this time. The first reason is that this is a single study. Epidemiological studies frequently give a wide variety of results, and one cannot determine if an association exists based on a single study. Secondly, only an abstract of this study is available. Until the results are actually published in a full article, one cannot assess the strengths and weaknesses of this study.

It should be pointed out that a press release preceded this abstract. In this press release the strength of the association for adult onset asthma and spousal ETS exposure was incorrectly stated (OR = 4.77 in the press release compared to 1.63 in the abstract). Anybody relying solely on the press release would have been severely misled.
